Findings

ECG Rhythm	ECG is sinus rhythm.
Study Quality	The quality of the study is adequate.
Left Ventricle	Left ventricle size is normal. The wall thickness is normal. RWT 0.27. Global left ventricular systolic function is normal, LVEF 55% (3D TTE) LV Diastolic Function is normal.
Right Ventricle	The right ventricle is normal in size. RV base 33 mm ; RV mid 26 mm ; RV length 57 mm. Wall thickness of the right ventricle is normal. Right ventricular systolic function is normal, TAPSE 26 mm
Left Atrium	Left atrial size is normal. LAVI 27 mL/m ² .
Right Atrium	Right atrial size is normal. RA area 11.2 cm ² .
Interatrial Septum	Intact interatrial septum. Bubble test was performed with and without the Valsava manœuvre. There is no microbubbles seen at LA within the first 5-6 beats after the complete opacification of RA with or without valsava. Negative bubble effect is not seen. However, a small quantity of microbubble (< 20 microbubbles) is seen in the LA after 6 beats, possibly caused by intrapulmonary shunting. There is no atrial septal aneurysm, hypermobile IAS or Chari Network.
Interventricular septum	Intact interventricular septum.
Aortic Valve	The aortic valve is trileaflet and opens well. There is no calcification. No aortic regurgitation is seen.
Mitral Valve	The mitral valve is normal in structure and function. No mitral regurgitation is seen.
Tricuspid Valve	Tricuspid valve is normal in structure and function. There is no tricuspid regurgitation.
Pulmonic Valve	Pulmonic valve appears normal. There is no pulmonary regurgitation.
Mass/Thrombus	There is no abnormal mass or thrombus.

Pericardium

Pericardium is normal.

Conclusion

- Intact interatrial septum
- Bubble test examination suggest a small / non significant intrapulmonary shunting
- Good LV systolic function, LVEF 55% (3D TTE)
- Global normokinetic
- Normal LV diastolic function
- Good RV contractility
